Summary

OverDrive – Team Skills

1- General context

2- Membres de l'équipe et compétences actuelles

3- Technologies envisaged

4- Forecasting Role Assignment

5- Identification of skills needs

6- Action plan

1- Train

2- Exercise

3- Plan

4- Get started

7- Conclusion

1- General context

The OverDrive project is based on an ambitious multi-platform architecture:

- Immersive VR/AR application
- Real-time backend
- Companion mobile application
- Web dashboard

The success of the project depends directly on the complementarity of the team's skills and its ability to improve competence on certain key technologies.

2- Team members and current skills

Anthony

- Frontend mobile
- 3D bases
- Interest in immersive environments

Natural positioning :

VR/AR (Unity) mobile support

Clément-Alexis

- Frontend web
- Frontend mobile

Natural positioning :

- Mobile application (Flutter)
- Dashboard web (Next.js / React)
- AR interface support if necessary

Bastien

- Backend
- Frontend web

Natural positioning :

- Main backend (API, WebSocket, database)
- Web integration support

Marie

- Frontend web
- Frontend Mobile

Natural positioning :

- Dashboard web
- Mobile application (Flutter)
- UX/UI
- Accessibility and visual consistency

Corto

- Backend
- Game development
- Frontend web

Natural positioning :

- VR/AR (Unity, interactive logic)
- Backend (real-time architecture)

3- Technologies envisaged

Field	Potential technology
VR / AR	Unity (C#)
Backend	Go
Frontend Mobile	Flutter
Frontend Web	Next.js / React.js
Database	PostgreSQL
Mask	Redis
Deployment	Docker / Kubernetes (éventuel)

These technological choices are consistent with:

- the required performance (real-time),
- multi-platform portability,
- long-term maintainability.

4- Forecasting Role Assignment

Membre	Rôle principal	Rôle secondaire
Anthony	VR/AR	Support mobile
Clément-Alexis	Front mobile	Front web / AR
Bastien	Backend	Support web
Marie	Front mobile	UX / Accessibilité
Corto	Backend	VR/AR

This distribution promotes:

- Specialization
- Minimal redundancy in critical components
- Overall technical consistency

5- Identification of skills needs

Skills required for the project

- Unity development (AR/VR)
- Real-time backend (API + WebSocket + DB)
- Mobile development
- Web development
- Possible video streaming management
- DevOps (Docker, Kubernetes)
- Cybersecurity
- 3D modeling (Blender)

Identified lacks

Despite the complementarity of the team, several axes of progress are identified:

1. Advanced mastery of Unity in AR/VR
 - VR performance optimization
 - Management of immersive interactions
2. 3D Modeling (Blender)
 - Creation of personalized assets
 - Optimization for VR
3. Video stream management
 - Understanding of technical constraints
 - Synchronization with live data
4. Advanced Secure Architecture
 - API security
 - Robust authentication management
 - Protection against common attacks
5. DevOps & scalable architecture
 - Complete Dockerization
 - Deployment via Kubernetes
 - Monitoring

6- Action plan

1- To train

- Official Unity documentation + Meta documentation
- Advanced AR/VR Tutorials
- Blender Tutorials
- Go documentation (clean architecture, WebSocket)
- Backend security tutorials
- Kubernetes / Docker Documentation

The team will not hesitate to ask qualified people or teachers for technical validation

2- To practice

- Development of Proofs of Concept (PoC)
 - Mini app VR
 - Real-time Mini API
- Test of a simple Kubernetes deployment
- Checking the maintainability of the backend
- Load rise simulation

This phase makes it possible to secure the choices before complete development.

3- To plan

- Final decision on the technologies chosen (Depending on performance, ease, team consistency)
- Final allocation of roles
- Establishment of a common environment:
 - Git
 - CI/CD
 - Code Standards
 - Clear project structure

4- To start

- Development of a simple and functional MVP
- Technical validation
- Progressive addition of complexity
- Short iterations and user test

Incremental approach to reduce technical risk.

Conclusion

The OverDrive team presents a solid and complementary foundation covering :

- Backend
- Web and mobile frontend
- 3D bases and game development

Needs to increase skills are identified, mainly in :

- Unity AR/VR
- DevOps
- Safety
- 3D modeling

A structured training, experimentation and planning plan ensures the success of the project. The strategy adopted is based on :

- A clear specialization
- A controlled progression
- Iterative development

This organizational framework strengthens the technical credibility and feasibility of the OverDrive project.
