February 16, 2026

Summary

OverDrive – Financial Balance Sheet

1- Base cost of the MVP

1. Recurring monthly costs
2. Problem identified

2- Projection for 1,000 users

- 1- Estimated monthly costs

3- Projection for 10,000 users

- 1- Estimated monthly costs

4- Overall summary

- 1- Estimated monthly costs

5- Strategic analysis of the balance sheet

6- Conclusion

1- Base cost of the MVP

OverDrive's MVP is based on:

- A lightweight cloud infrastructure (backend, PostgreSQL database, Redis, object storage)
- Subscriptions to broadcasting platforms for comparative analysis (F1 TV, Rally TV, MotoGP, etc.)
- Minimal hardware for VR development

1- Recurring monthly costs

Cloud infrastructure (VPS + PostgreSQL + Redis + object storage)

≈ 30 € / month

(realistic fork : 20–40 €)

Motorsport platform subscriptions (benchmarking and analysis)

≈ 50 € / month

(according to the formulas chosen)

Total Monthly Cost MVP

≈ 80 € / month

(excluding salaries – academic framework)

2- Initial investment (non-recurring)

VR headset – Meta Quest 3S

≈ 300 €

3 development positions (≈ 1,200€ each)

≈ 3 600 €

Estimated initial capital investment

≈ 3 900 €

2- Projection for 1 000 users

Moving from a demonstration environment to approximately 1,000 active users involves :

- Upgraded backend server
- Larger PostgreSQL database
- More robust Redis instance
- More structured monitoring and backups

The architecture remains the same, but the resources increase.

1- Estimated monthly costs

Cloud infrastructure sized for “small production”
≈ 80–120 € / month

Motorsport subscriptions (unchanged)
≈ 50 € / month

Total monthly cost for 1 000 users
≈ 130–170 € / month
(hors coûts humains)

At this stage, the infrastructure remains single-region, without advanced redundancy, but capable of absorbing usage peaks during major events.

3- Projection for 10 000 users

To reach 10 000 users, the architecture needs to evolve towards a logic closer to that of a commercial product. :

- Multiple backend instances behind a load balancer
- Minimal autoscaling
- More powerful PostgreSQL database, possibly with replicas
- Larger managed Redis instance
- Enhanced monitoring
- Automated backups
- Increased bandwidth

1- Estimated monthly costs

Scalable and more secure cloud infrastructure
≈ 300–600 € / month

Motorsport subscriptions
≈ 50 € / month

Total monthly cost for 10 000 users
≈ 350–650 € / month
(excluding salaries)

This level corresponds to a credible architecture for an initial commercial launch, with a level of robustness suitable for high-audience events.

4- Overall summary

Scenario	Initial investment	Estimated monthly cost
MVP	≈ 3 900 €	≈ 80 €
1 000 users	-	≈ 130–170 €
10 000 users	-	≈ 350–650 €

5- Strategic analysis of the balance sheet

Several lessons emerge :

1. The infrastructure remains relatively inexpensive, even with 10 000 users.
2. Scaling up is gradual and manageable.
3. The main real cost of the project is not technical but human.

In a professional context, the complete development of an MVP such as OverDrive would represent an estimated investment of between 35 000€ and 75,000€ (depending on the complexity, the team and the expected level of finish).

Conclusion

The financial statement shows that :

- OverDrive is economically viable in its MVP phase with a very limited budget.
- Scaling up to 10,000 users remains financially reasonable.
- The real economic challenge lies in development, product strategy, and user acquisition, far more so than in the cloud infrastructure.

If you want, we can now write a section on “**Business model and break-even point**” to complete the financial logic of your file.
